

A safety "with it" !

As well as improving the grip between lever and fingers, a ball end will make the otherwise pointed lever less dangerous in the event of an impact.

The hole in the duralium (not soft alloy) balls is of a size to locate direct to the slimstyle levers, on other models the lever tip will require filing as illustrated. The balls should be driven home by using a hide hammer or a block of hard wood between the ball and a conventional hammer. If the lever is filed too small use a top quality adhesive such as Araldite to effect a strong bond. Lever balls 10/6d. per pair.

NOTE We have complete ball end levers for Lambretta widestyle and slimstyle, Vespa Sportique, G.S. 160 and S.S. 180 machines for 22/6d. per pair.

Prices include Postage and Packing.
